KHALA RESEARCH

RESEARCH REPORT
NOVEMBER 2026

Pricing privacy

Demand for on-chain privacy is established. Whether it accrues to token holders depends on what each network sells, who pays for it, and where that value ends up.

Market data to 15 October 2026

Contents

Executive summary 3

The case for privacy

Corporate payment flows now settle on public ledgers, and the founders of the industry are building confidentiality into its base layer.

Why demand for privacy is rising 5–8

Where markets pay for privacy 9

Value capture across the coverage universe

What each privacy network sells, who pays for it, and how much of that value reaches the token.

The five tokens compared 11

Zcash, Aztec, Umbra and Venice 12–15

SN25 UR and the network privacy opportunity

An established user base, with a mechanism for converting usage into token demand that is built but not yet switched on.

Why network privacy matters 17

URnetwork and how SN25 works 18–20

The bull case and operator pipeline 21–23

Scenarios and catalysts 24–25

Privacy demand is real, but few tokens yet turn it into fees or buybacks for holders

1	Companies now need confidentiality to transact on-chain	$306B of stablecoins settles on transparent ledgers, the first confidential payroll and OTC trades were executed in 2026, and US policy has moved from sanctions to an approved privacy ETF.	$306B stablecoins on public ledgers
2	Markets reward privacy only where demand reaches the token	Zcash is held as money and Venice buys back its token with revenue, and both are valued above $1B, while the network-privacy tokens we track are worth about $46M combined.	$46M all network-privacy tokens combined
3	Most privacy tokens do not yet connect usage to value	Aztec's sequencers stake $12M against $58K of user funds, Umbra's fees accrue to a DAO treasury rather than to holders, and UR's operator deposits are set at zero while the network launches.	$58K user funds secured on Aztec
4	SN25 UR offers the clearest path to closing the gap	URnetwork reports about 350K monthly users, and the operator-deposit mechanism that converts usage into SN25 demand is built and switches on once deposits are priced after launch.	350K monthly users (team-reported)

CATALYSTS TO WATCH | First operator deposit on SN25 | Aztec v6 and the 13 November unlock | Umbra's Nimbus network launch | Storm retrial, 26 April 2027

The case for privacy

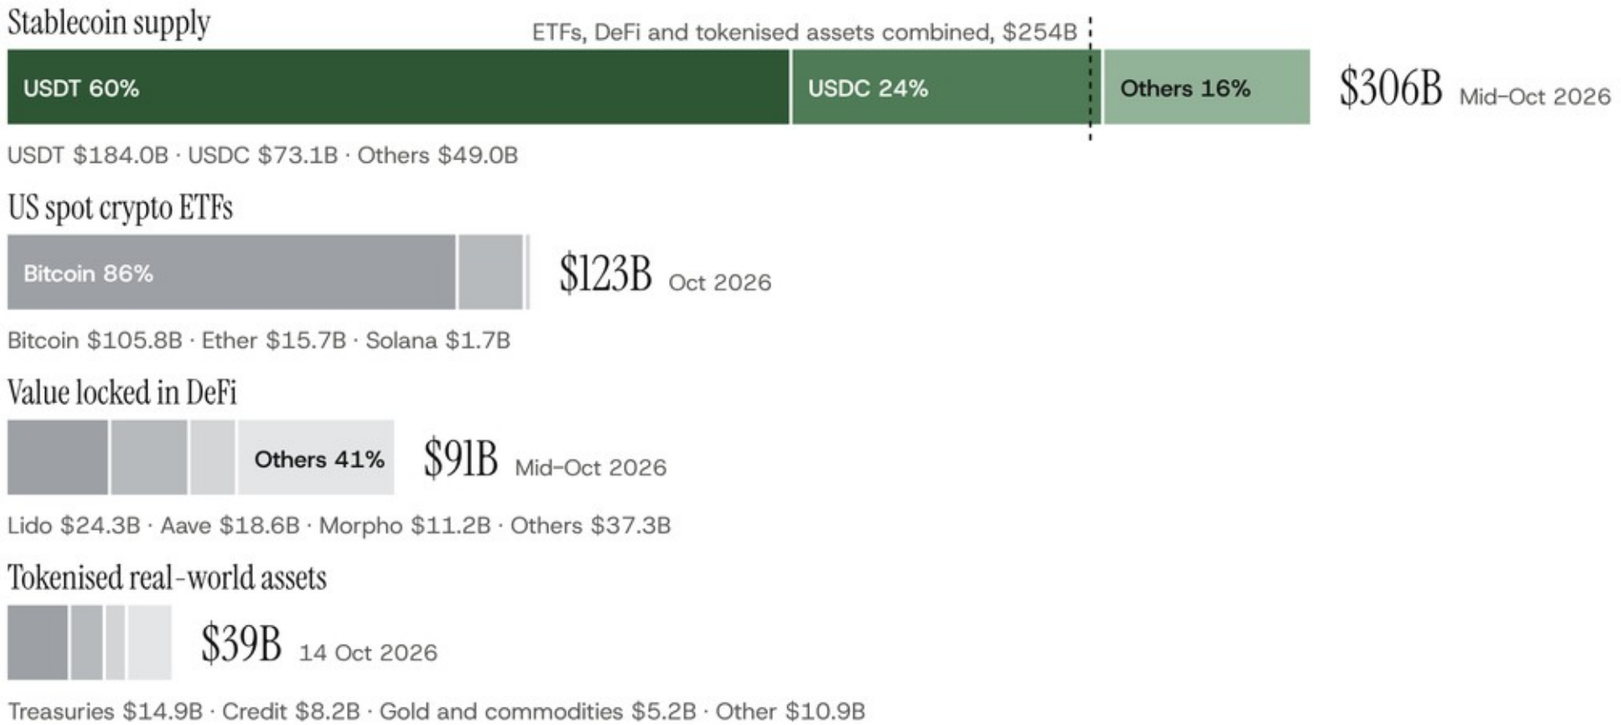

Corporate payment flows now settle on public ledgers, and the founders of the industry are building confidentiality into its base layer.

IN THIS SECTION

Stablecoins on public ledgers	5
Buterin and Durov	6
Policy has turned	7
Payroll and trading	8
Where markets pay for privacy	9

$306B of stablecoins now settles on fully transparent ledgers

That exceeds crypto ETFs, DeFi and tokenised assets combined, and every transfer, balance and counterparty relationship is visible to anyone.

Capital in selected onchain financial products, USD. ETF figures are net assets; tokenised assets are distributed value.

Once an address is linked to a company, its payroll, supplier terms and treasury positions become public record.

Tether and Circle issue 84% of supply, so most activity runs through two contracts any analyst can monitor.

At this scale, confidentiality becomes an operating requirement for corporate treasuries rather than a user preference.

"For users that prioritize privacy, this could become a 'must-have' feature."

Zach Pandl, Head of Research, Grayscale, on AI and financial privacy, September 2026

Buterin and Durov both treat privacy as core infrastructure, not a feature

The founders of Ethereum and of a messaging app with over a billion users reach the same conclusion from different starting points.

Vitalik Buterin

Co-founder

Ethereum

"Privacy is not about standing apart. It's about standing together."

Why I support privacy, 14 April 2025

Why it matters	Control over information is power, so privacy protects decentralisation, personal freedom and institutions such as the secret ballot.
Where it belongs	In the protocol itself, covering payments, application activity, chain reads and network-level anonymity.
Current gap	Largely a roadmap, with adoption dependent on wallets and applications implementing it.

Same conclusion

Pavel Durov

Founder and CEO

Telegram, over 1B monthly users

"Telegram would rather exit a market than undermine encryption with backdoors and violate basic human rights."

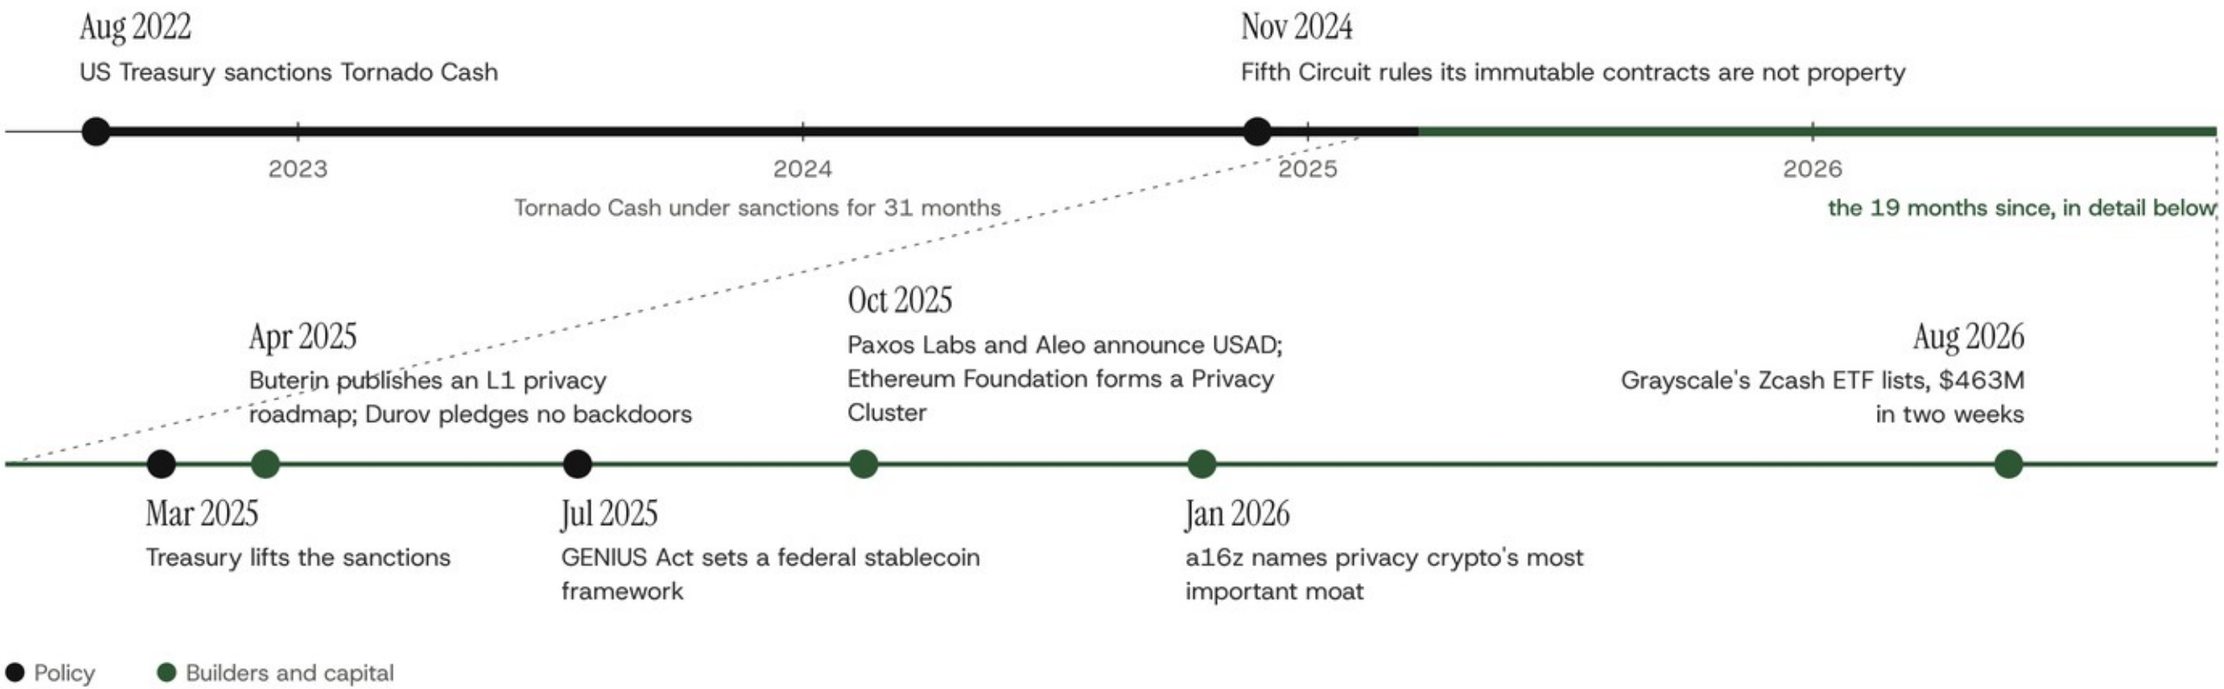

Telegram channel, 21 April 2025

Why it matters	Encryption protects everyday communication and personal safety, and any access built for authorities is also available to attackers.
Where it belongs	In the product, with no backdoors, even at the cost of withdrawing from a market.
Current gap	Telegram's default Cloud Chats are not end-to-end encrypted; only Secret Chats are.

Implication	Both positions point to privacy embedded at the infrastructure layer from the outset, which favours protocols over standalone privacy applications.

In four years the US moved from sanctioning Tornado Cash to listing a Zcash ETF

Sanctions were lifted, builders returned and institutional capital followed, although developer liability remains unresolved.

Upper axis to scale from mid-2022; lower axis expands March 2025 to October 2026. Developer liability is still open: Roman Storm's retrial is set for April 2027.

Payroll and trading lead adoption because disclosure there is most costly

Encrypting amounts is not sufficient on its own, because the network connection can still reveal who is transacting.

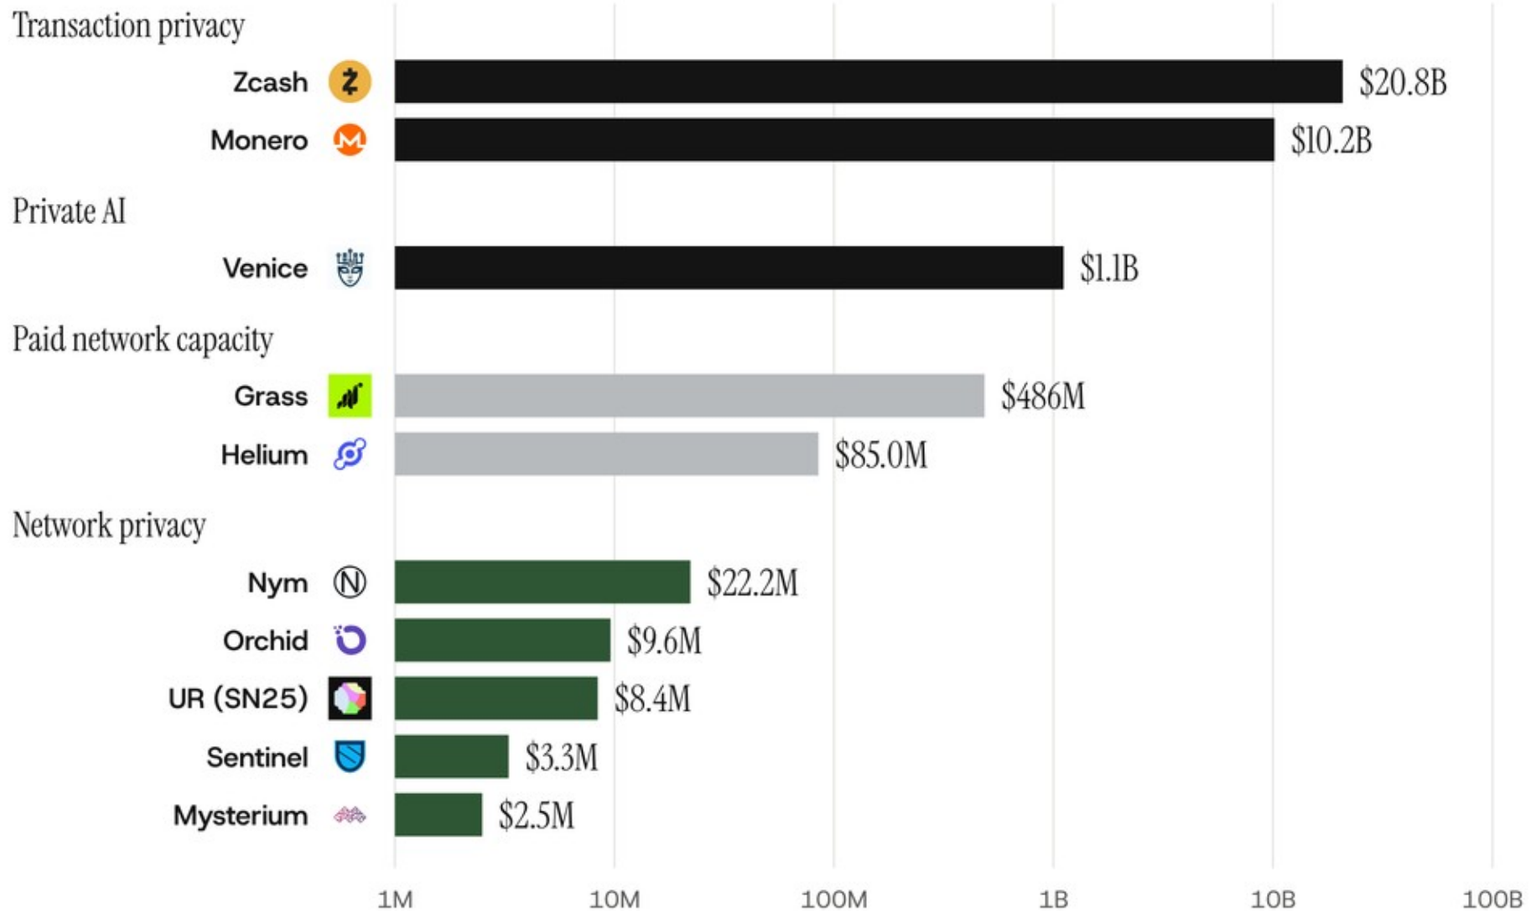

Use case	What must stay private	Evidence so far	Who is building or backing it
Payments and payroll *Company-reported deployments*	Salaries, supplier invoices and treasury movements	Bron paid salaries in confidential USDT on Ethereum mainnet through Zama, January 2026	Zcash · Monero · Umbra · Zama · Bron · Aleo
Trading and tokenised assets *Company-reported deployments*	Orders, positions and holdings	GSR executed a confidential OTC trade on the Zama protocol, March 2026; Dfns added confidential tokens to its wallet platform	Zama · Dfns · Pantera *investor*
Private computation and AI *NEAR AI live; others building*	Customer data and model inputs	NEAR AI Cloud runs confidential inference with an attestation per request; secure-hardware and MPC networks are building	Venice · NEAR AI · Seismic · a16z *investor* · Nillion · Hack VC *investor*
Private connectivity *URnetwork live; others building*	IP addresses and who is talking to whom	URnetwork's VPN reports about 350K monthly users (team-reported); NymVPN runs on the Nym mixnet	SN25 UR · Nym · Orchid · Sentinel · Mysterium
Programmable privacy *Building*	Hidden inputs for sealed-bid auctions, private ballots and strategy games	Reusable tools, so each application does not need its own cryptography	Fhenix · Zama · Multicoin *investor* · Aztec · Noir

Markets have paid for privacy only where demand reaches the token

Zcash is held as money and Venice buys back its token with revenue, and both are valued above $1B, while networks without that link are valued in the tens of millions.

Grass and Helium make the same point for network capacity: paying customers and token-level value capture support materially higher valuations.

This report applies the same test to each token in our coverage universe.

Market cap, USD, log scale. CoinGecko and MEXC, 15 October 2026.

Value capture across the coverage universe

What each privacy network sells, who pays for it, and how much of that value reaches the token.

Privacy token landscape	11
Zcash	12
Aztec	13
Umbra	14
Venice	15

Privacy token landscape

The first generation of successful privacy products protected money and DeFi: Zcash for private payments, and Aztec and Umbra for private balances and trading on Ethereum and Solana.

The emerging opportunity is privacy for everyday workflows such as AI, browsing, email and internet access. Venice already serves millions of users, and UR's network is built to host new operators across VPN, email and AI-agent access.

	Zcash	Aztec	Umbra	Venice	SN25 UR NEW ENTRANT
What it produces	Private money: shielded $ZEC transfers hide addresses, amounts and memos; transparent transfers remain possible	Ethereum L2 for private smart contracts: confidential balances, state and execution	Private balances, transfers and swaps for Solana assets; deposits and withdrawals stay public	Private AI chat, images and API access on open-source models; prompts are not stored on its servers	Bandwidth and routing marketplace: independent providers carry traffic, validators score performance
Active users	~348K transactions in 30 days; no user count	Tens of transactions a day; no user count	$187K deposited; no user count	~3M active users (company-reported)	350K+ monthly active users (team-reported)
Who pays for it	Senders pay fees; miners and the development fund are also paid from new issuance	Users pay fees or apps sponsor them; operator rewards are partly token emissions	Users pay protocol fees and relayer tips; protocol revenue accrues to the DAO treasury	Users pay subscriptions or API credits, or stake $VVV for a daily share of inference	Customers pay operators; URnetwork's UR Pro subscription is operator revenue, not automatically subnet revenue
Does value reach the token	• MONETARY ASSET $ZEC is the money, the fee and the mining reward, with a fixed cap. The bet is demand to hold	• FEE + STAKE $AZTEC funds fees, staking and governance; congestion fees burn, the rest pays operators	• GOVERNANCE $UMBRA governs the treasury via MetaDAO markets; no automatic buyback or dividend	• STAKE + BURN $VVV is staked for inference capacity, and a share of credit purchases buys back and burns it	• OPERATOR DEPOSITS UR alpha funds emissions and locked operator deposits, which can be zero; buys not enforced

SOURCES: PROTOCOL DOCS AND WEBSITES · OCT 2026

Zcash's valuation reflects demand for the option of privacy rather than its current use

The shielded share of supply rose through 2025 before retreating in 2026.

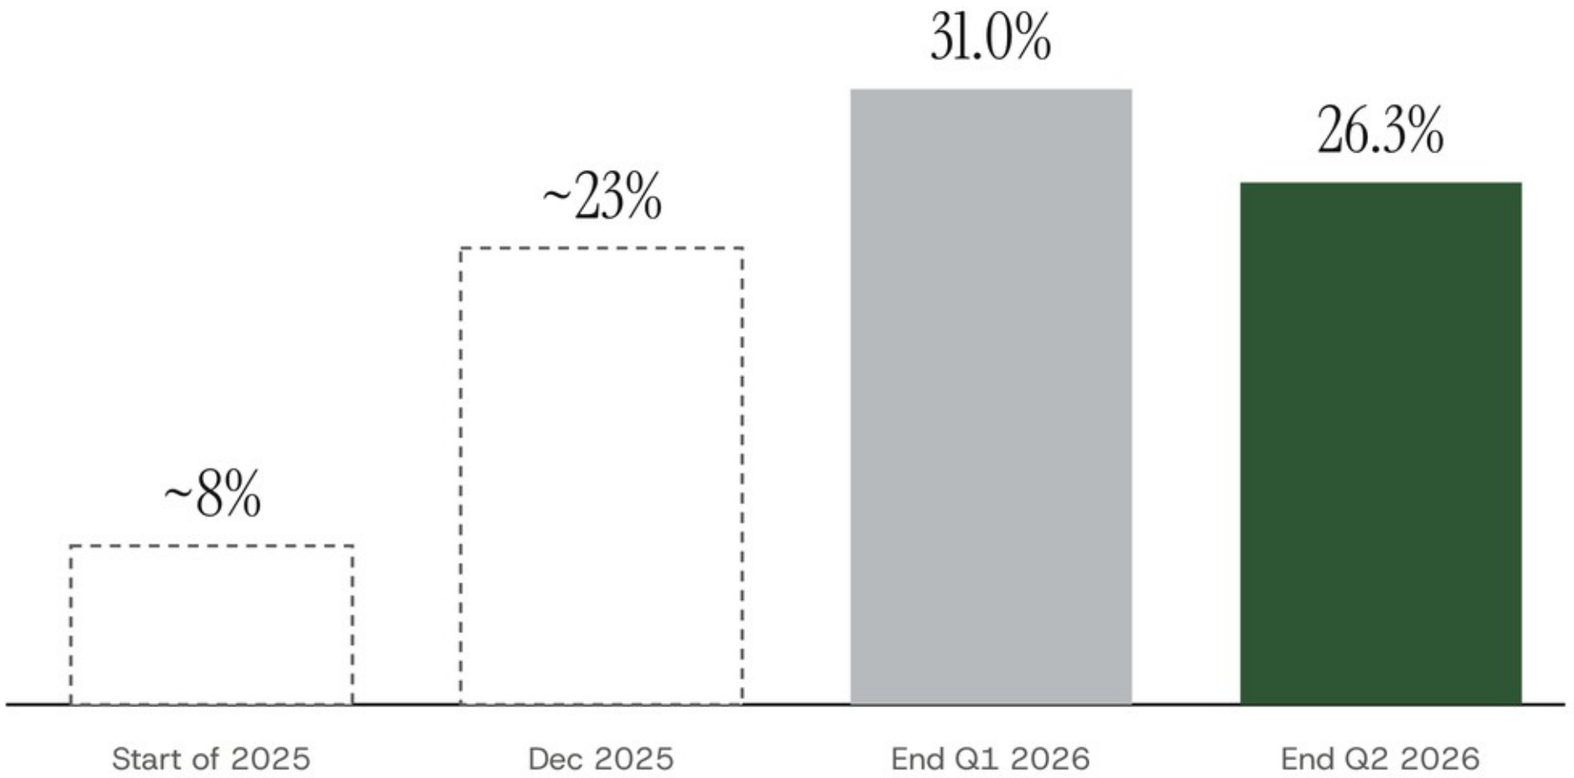

ZEC trades at roughly twice Monero's market value and is held in a US-listed ETF, yet most network activity still settles on the transparent side.

Investors are paying for optionality on private use that has yet to materialise at scale.

Q2 2026 network fees

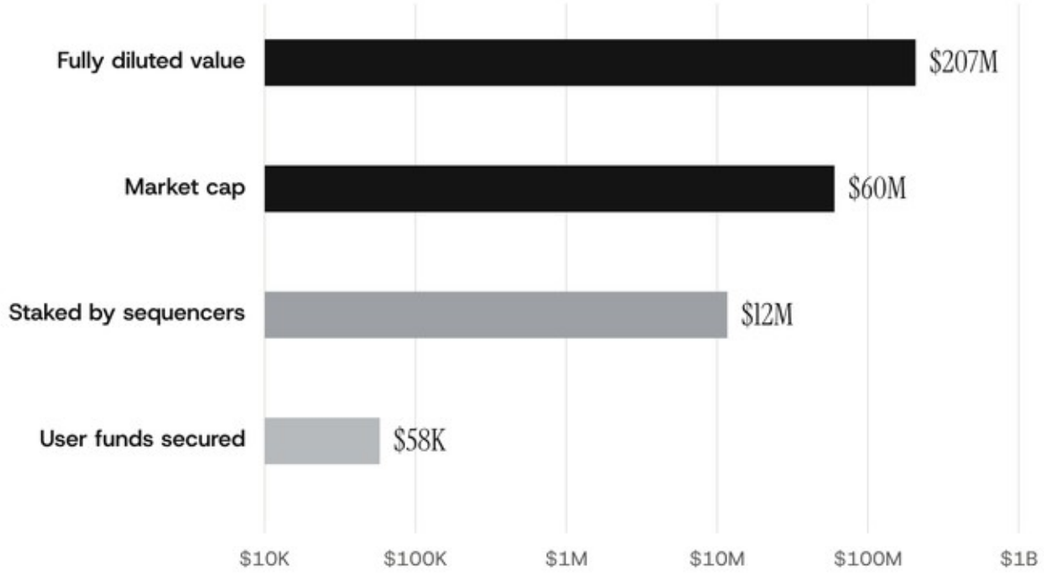

Transparent ~$92K Shielded ~$18K

Share of ZEC supply held in shielded pools. approximate reported latest

Aztec's sequencers have staked $12M to secure only $58K of user funds

Aztec's token design is among the most complete in the group, but usage has yet to arrive and the current release carries a disclosed critical vulnerability.

What it sells

Private smart contracts on Ethereum: confidential balances, state and execution, written in Noir.

How value reaches the token

Fees are paid in AZTEC, congestion fees burn, and sequencers must stake 200,000 AZTEC to produce blocks.

What has to be true

v6 closes the proving bug disclosed on 7 August, and apps bring user funds well above today's $58K.

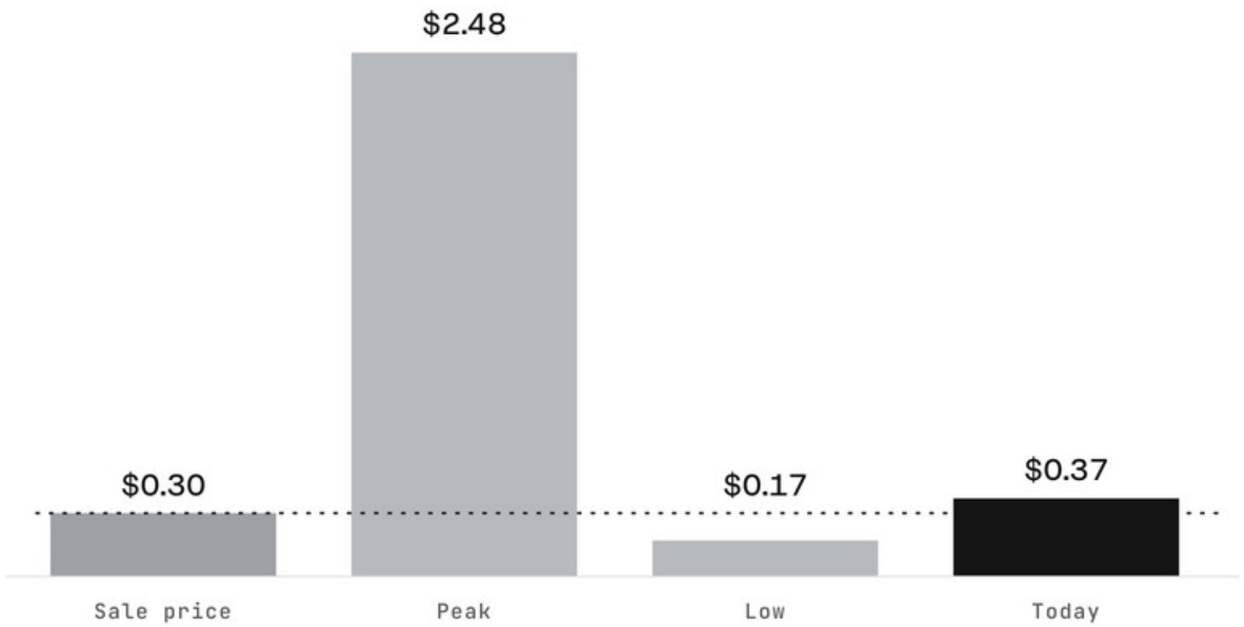

Supply risk

Only 29% is circulating, the Foundation unlocks on 13 November, and governance can mint up to 20% of supply a year.

Price $0.020 and supply 10.35B (CoinDesk, 14 October 2026); circulating supply and unlocks (Tokenomist); staking, value secured and minting limit (L2BEAT, 16 October 2026); vulnerability notice (Aztec, 7 August 2026).

Umbra ties team vesting to price targets, but holders have no direct claim on fees

Umbra sells private balances, transfers and swaps on Solana, and its token governs a treasury rather than collecting fees.

What it sells

A private wallet for Solana assets with screening and viewing keys; Nimbus, its network for other apps, is coming soon.

How value reaches the token

Fees go to a DAO treasury that UMBRA holders steer through MetaDAO markets. There is no automatic buyback or dividend.

Why the vesting matters

Team and adviser tokens unlock only when fully diluted value reaches 2x, 4x, 8x, 16x and 32x the $0.30 sale price.

What has to be true

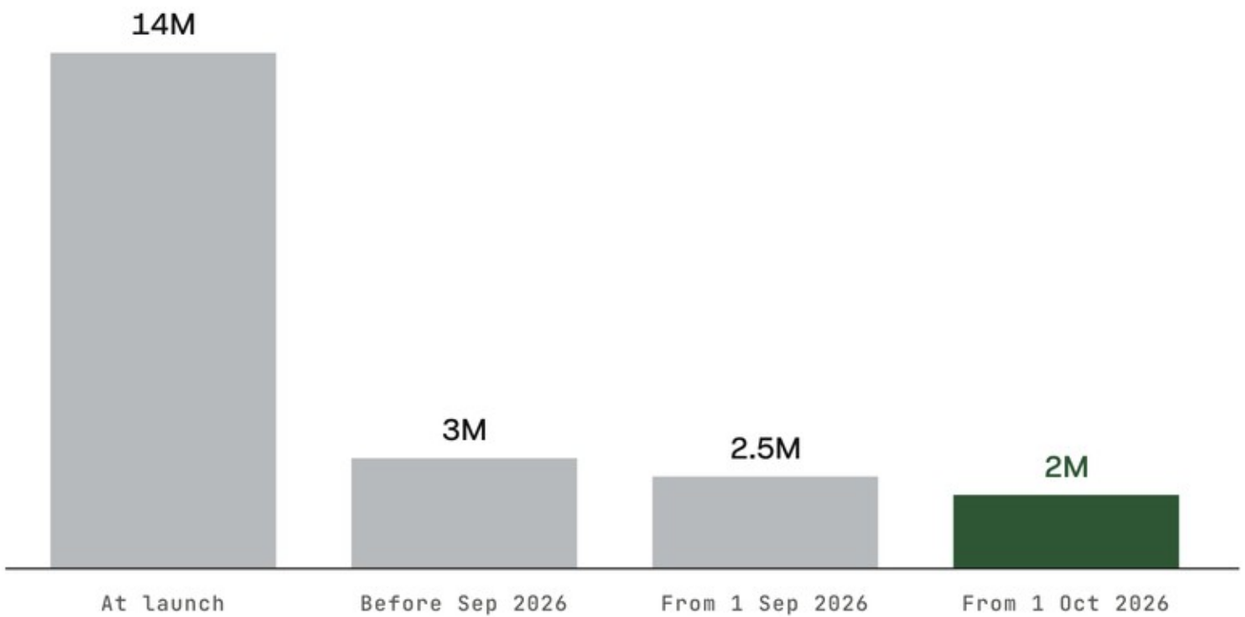

Nimbus brings other apps onto Umbra and deposits grow well beyond today's $187K.

Price, market cap $5.2M, fully diluted $10.2M and deposits (DefiLlama, 15 October 2026); sale terms (MetaDAO; The Block, 10 October 2025); vesting (Blockworks token transparency filing, 29 September 2026). Not the Ethereum stealth-address project of the same name.

Venice is the only token we cover that uses customer revenue to buy back its own supply

Venice sells private AI chat and API access. Paying users fund VVV buybacks, while annual issuance has been cut from 14M to 2M tokens.

New VVV issued per year

What it sells

Private AI chat, images and API access on open-source models. Prompts are encrypted on the device and not stored on Venice's servers.

How value reaches the token

Staked VVV earns a daily share of inference capacity and mints DIEM, worth $1 of API credit a day. $5 of every $100 of credit purchases buys and burns VVV.

Evidence of demand

3.5M registered users and a $100M annualised revenue run rate (company-reported, August 2026), after a $65M Series A at a $1B valuation led by Dragonfly.

What has to be true

Revenue keeps growing so buybacks outpace the remaining issuance, and holdings become less concentrated than today's top wallets.

Market cap about $1.1B and price about $23 (CoinGecko, mid-October 2026). Issuance: Decrypt, 21 September 2026; Phemex, 19 August 2026. Users and run rate: Erik Voorhees via Phemex, August 2026. Series A: TechCrunch via AI Weekly, 1 July 2026.

SN25 UR and the network privacy opportunity

An established user base, with a mechanism for converting usage into token demand that is built but not yet switched on.

Where privacy leaks	17
URnetwork users	18
How SN25 works	19
Operators as SN25 buyers	20
The bull case	21
How value reaches UR	22
UR can host operators in billion-dollar enterprise and AI-agent markets	23
What to watch	24
Catalysts across all five	25

In controlled tests, network timing alone linked more than 95% of wallet users to their IP addresses

Only five of the 18 privacy projects we track protect who the user is, and transaction privacy fails where funds cross chains and where a wallet connects to the network.

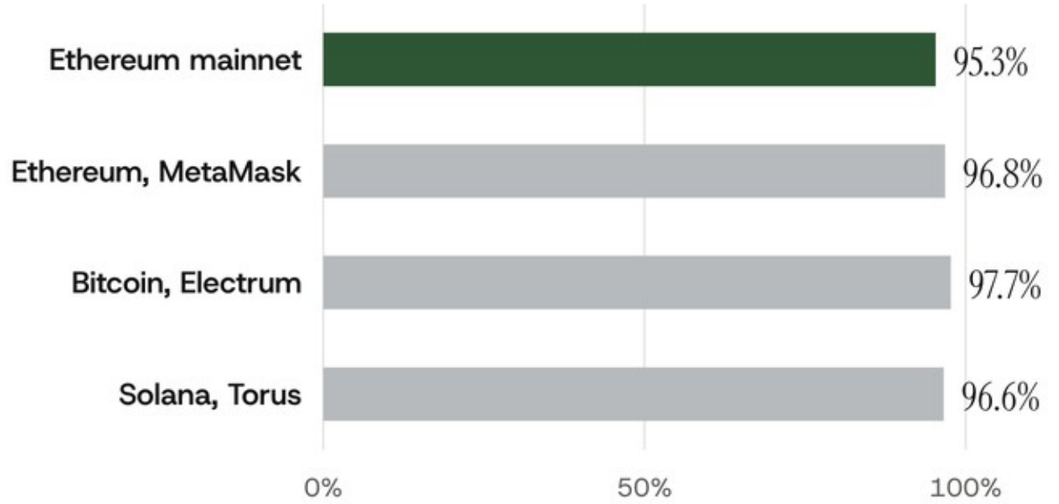

Crossings leak: the swap route into private Zcash

$1.5B+

ZEC swap volume through NEAR Intents by March 2026 (sponsored research)

Connections leak: wallet users a passive observer identified

Wang et al., arXiv preprint, experiments March to April 2025. The observer watches traffic at internet exchanges or provider routers. Bitcoin and Solana rows ran on testnets. The authors name Tor or VPNs as possible defences.

URnetwork reached about 350K monthly users before any operator deposit on SN25

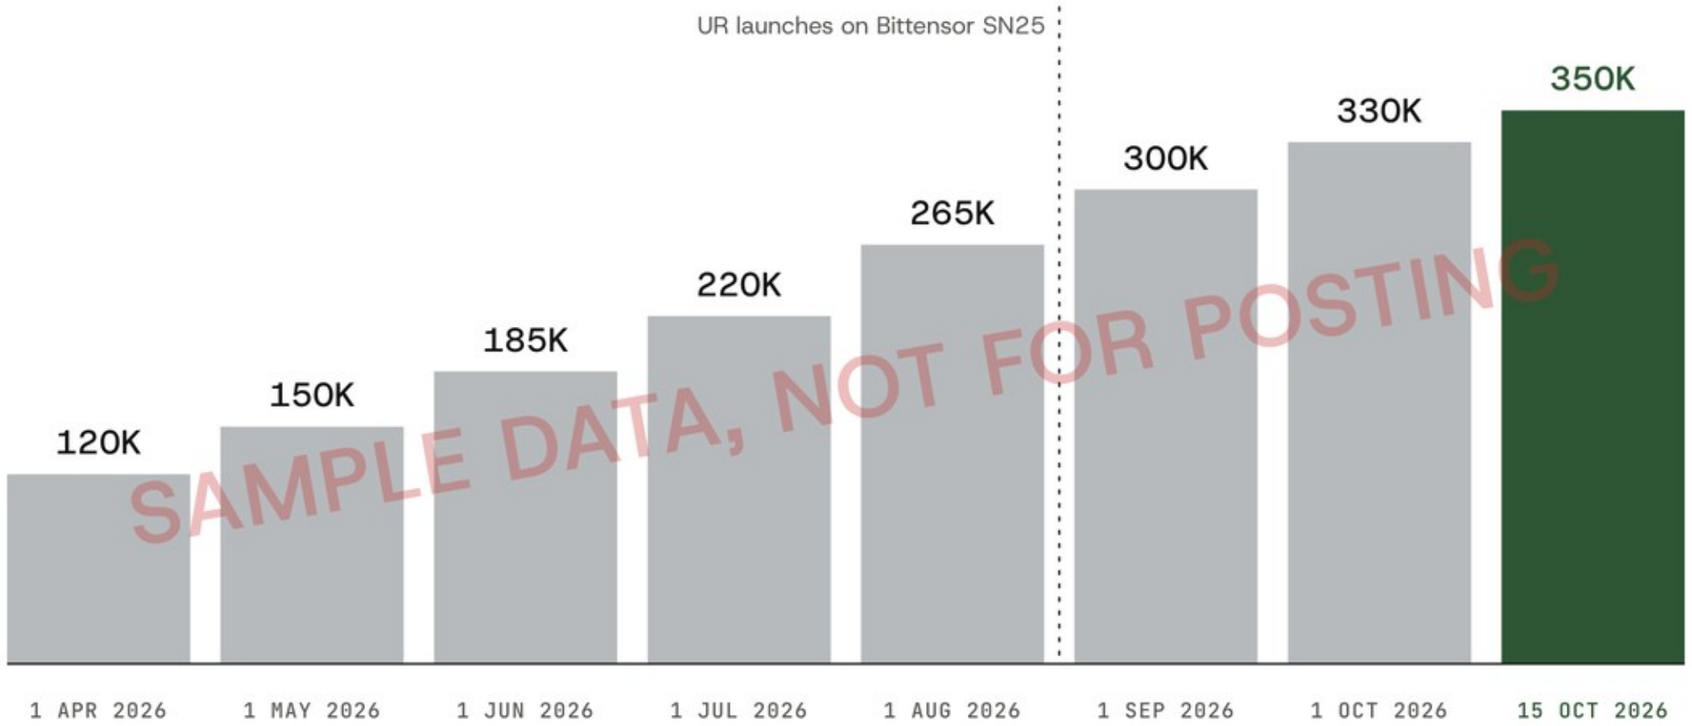

Monthly active users of the URnetwork VPN, first day of each month (team-reported).

126,717

providers across 103 countries

The user base already exists while the deposit rate is set at zero for launch, so the open question for SN25 is pricing rather than demand.

Each month of growth enlarges the base that operator deposits will be sized against once the reference rate is set.

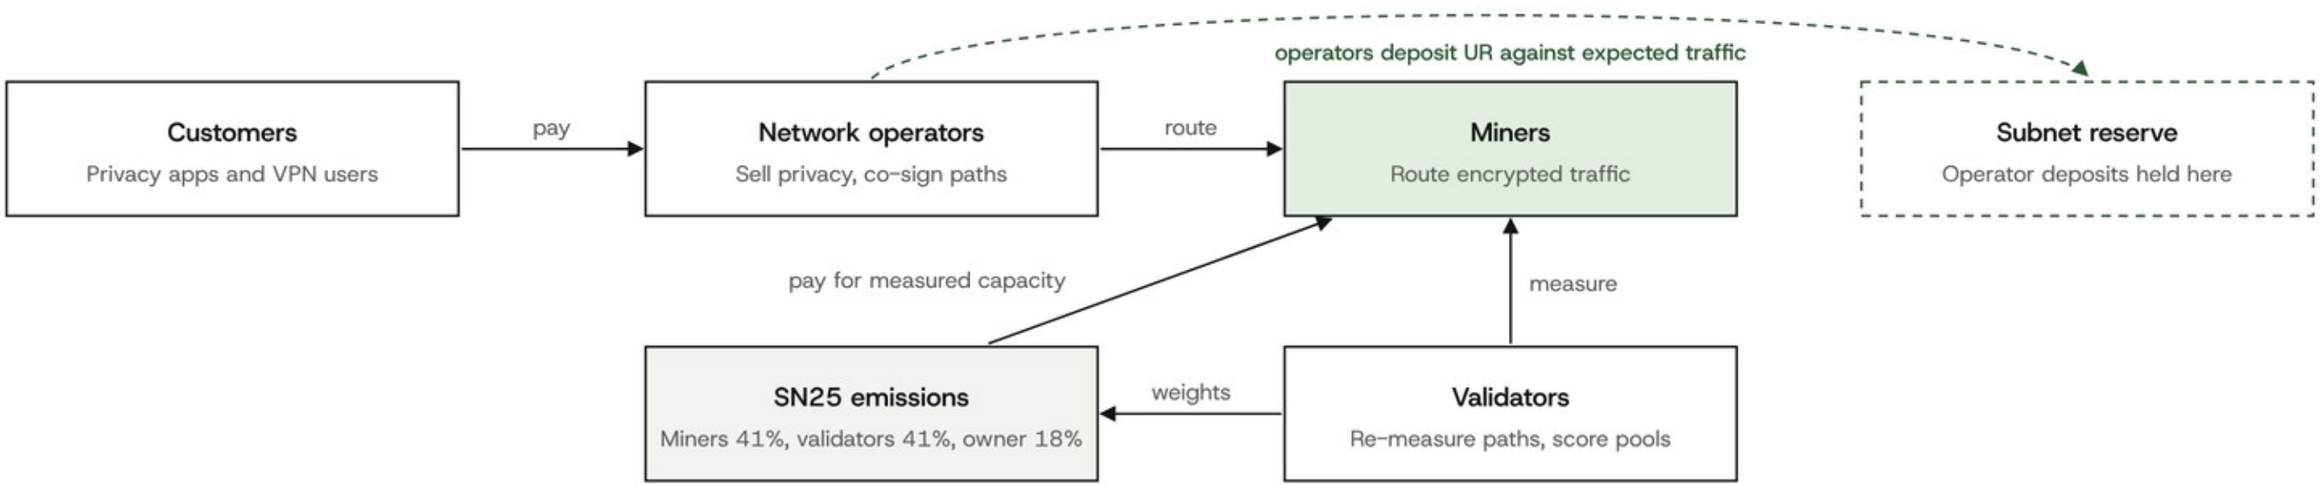

SAMPLE DATA, NOT FOR POSTING

Monthly active users and providers are team-reported. Source: URnetwork.

UR pays miners only for routing capacity that Bittensor validators have independently measured

Customers pay operators, operators route traffic through miners, and validators verify the work before emissions are paid.

Solid lines run today on mainnet, including validator measurement and weights. The dashed line is the deposit link, which switches on once deposits are priced after launch. Deposits

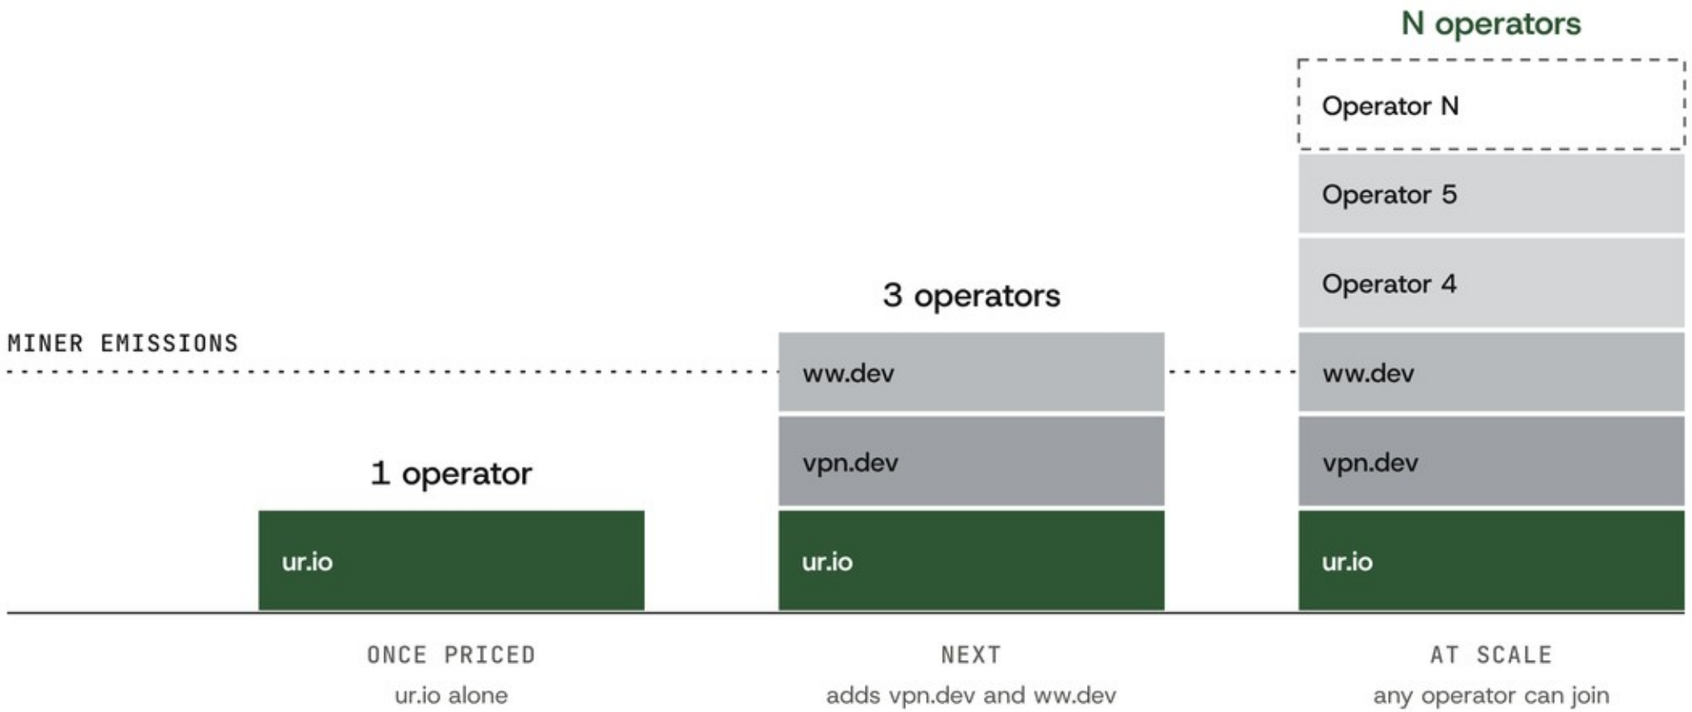

126,717	103	~200	$8.4M
Providers on URnetwork (team-reported)	Countries covered (team-reported)	Top-level miner fleets, ranked by distinct exit IPs	SN25 market cap, mid-October 2026

Every new operator on UR becomes a structural buyer of SN25

Once deposits are priced, operators must acquire and lock SN25 in proportion to the users and data they serve.

Above the dotted line, operators buy more SN25 than miners receive in emissions.

Deposits sit in a reserve that never pays out, so every unit purchased leaves circulating supply permanently. Where the line sits depends on the reference rate UR sets.

Illustrative, not a forecast. The deposit rate is set at zero for the launch period and UR has not yet set prices. Mechanism: UR SN25 architecture (September 2026); UR Foundation SN25 repository.

At Helium's valuation SN25 would be a 10x, and at Grass's a 58x

URnetwork already reports about 350K monthly users, yet SN25 is valued at $8.4M, below both comparable networks whose customers pay for capacity.

A wide valuation gap

Transaction-privacy assets are valued at about $31B, against roughly $46M for the five network-privacy tokens we track, a gap of around 670 times.

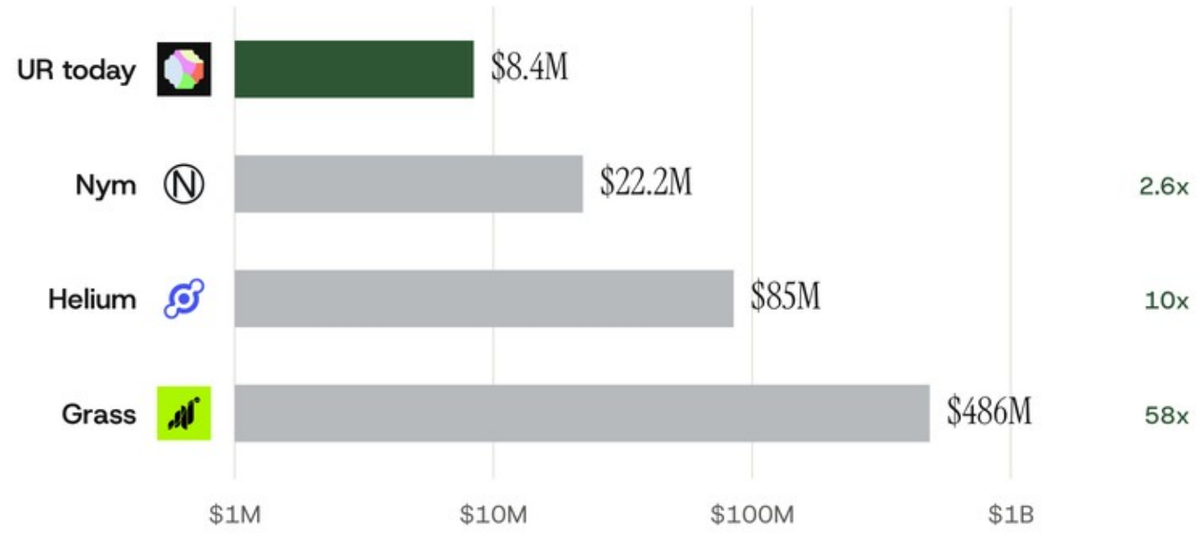

A product already in market

URnetwork, the VPN that SN25 supplies, reports about 350K monthly users and 126,717 providers across 103 countries, so the thesis does not depend on a product launch.

Demand linked to usage

Once the deposit rate rises above zero, operators must acquire and permanently lock UR in proportion to their traffic, converting customer growth into token demand. Until then, TAO inflows fund supply.

What UR would be worth at its peers' market caps

Market cap, USD, log scale. CoinGecko and MEXC, 15 October 2026. Multiples compare market caps today and are illustrative, not price targets.

UR holders receive no revenue today, and the token depends on TAO inflows until operators begin paying

The litepaper excludes any right to profits, and the operator deposit rate is set at zero for the launch period.

How value reaches SN25, most likely first

1	**TAO inflows** Bittensor sets each subnet's emissions by its net TAO inflows over about three months, so staking into SN25 lifts emissions and alpha demand.	Live since November 2025
2	**Sector re-rating** SN25 trades as Bittensor's privacy exposure while capital rotates into the category.	Live
3	**Operator deposits** Operators acquire UR to deposit against traffic, and deposits stay in the reserve rather than returning to circulation.	Rate set to zero at launch
4	**Reserve governance** Future onchain governance could direct how the reserve is used.	Speculative; no proposal

Ranked by likelihood. The deposit pathway is the one that turns UR from a subsidised network into a paid one.

UR can host operators in billion-dollar enterprise and AI-agent markets

ur.io is the first operator, and UR's research programmes target enterprise access and AI agents on the same 100,000+ node network.

Operator	Market	What it does on UR	Comparable web2 business
ur.io	Consumer VPN **Live**	350K+ monthly users today (team-reported)	The live proof that the network serves real demand
Project Bastion	Enterprise network access **Research**	Secure access for companies, their staff and their devices	**Zscaler** $3.77B ARR, FY2026
Project Meridian	Identity and private access for AI agents **Research**	Gives agents their own credentials and private routes to company systems	**Tailscale** $1.5B valuation, 2025
Project Stargate	Open web access for AI agents **Research**	Residential routes that let agents browse, retrieve and index the open web	**Browserbase** $300M valuation, 2025
+ Third-party operators	White-label VPN, encrypted mail, private search **Open to build**	Any business can bill users and data on the same network	**Bright Data** $300M ARR in residential data access

Operator pipeline: UR, Introduction to SN25 (August 2026). Comparables: Zscaler FY2026 results; Tailscale Series C (2025); Browserbase Series B (SiliconANGLE, 17 June 2025); Bright Data ARR (reported 2025). Comparables show market scale, not UR forecasts.

Every operator draws on the same miner fleet, so new demand arrives without new supply cost.

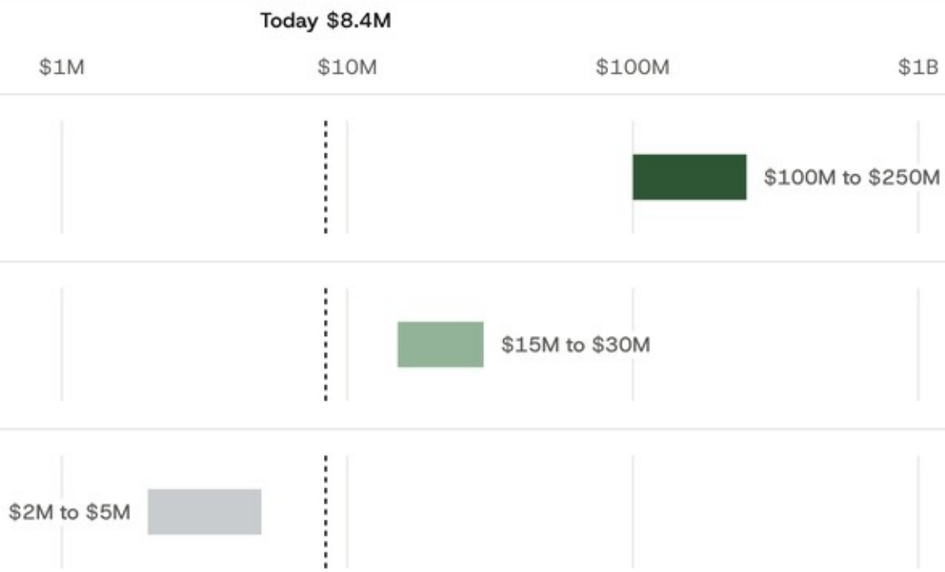

AI agents are routinely blocked by bot controls and data-centre IP detection, and residential routes are what let them reach the open web.

That makes agents a natural second wave of operators after consumer privacy apps, each one buying and locking SN25 for the traffic it serves.

Our base case implies 1.8 to 3.6x by the end of 2027, and our bull case 12 to 30x

The outcome turns on a single variable, operator deposits on SN25, which are set at zero during launch.

Scenario	What has to happen	From today
Bull	Wallets and privacy apps buy capacity, and operator deposits reach a quarter of miner emissions.	12x to 30x
Base	Deposits switch on in 2027, and two to four operators pay small amounts.	1.8x to 3.6x
Bear	The deposit rate stays at zero, there is still one operator, and TAO flows out of SN25.	-76% to -40%

Implied SN25 market cap by end 2027, log scale. Illustrative ranges, not forecasts or investment advice.

The number to watch

Monthly operator deposits on SN25. The first non-zero deposit moves UR out of the bear case, and deposits worth a quarter of miner emissions put it in the bull case.

Seven dated events and signals will determine how these tokens trade into 2027

Key catalysts for each token in our coverage universe, in expected order.

When	Token	Event	Why it matters
13 Nov 2026	**Aztec**	Foundation token unlock	Adds supply while user funds secured are still under $100K
Late 2026	**Aztec**	Version 6 fixes the critical proving bug	Aztec asked teams to pause new deployments until then
Coming soon	**Umbra**	Nimbus developer network and SDK	First sign that other apps will route fees to Umbra
When priced	**SN25 UR**	First operator deposit	Turns users into SN25 buying; the rate is set at zero for launch
Quarterly	**Zcash**	Shielded share and US ETF holdings	Shows whether demand to hold is turning into private use
Ongoing	**Venice**	Burn volumes and the Venice V2 video rollout	Shows whether revenue growth is reaching VVV holders
26 Apr 2027	**All five**	Roman Storm retrial on laundering and sanctions counts	A conviction would raise legal risk for every privacy developer

Unlock date: Tokenomist. Aztec v6: Aztec, 7 August 2026. Storm retrial: The Block, 26 August 2026.

Demand against value capture	27
What a ledger gives away	28
AI raises the stakes	29
The privacy map	30
UR against its rivals	31
What could break it	32

Zcash and Venice pair proven demand with value accrual, while UR has the demand but not yet the mechanism

Each token is placed by the usage it can demonstrate and how directly that usage accrues to the token. Circle size reflects market value.

Khala Research placement. Market data 14 to 15 October 2026; UR users team-reported; Aztec usage from L2BEAT.

A single linked address exposes a company's payroll, supplier terms and treasury activity to its competitors

An illustrative month of stablecoin payments at a fictional company, as a competitor would see it.

Corporates do not need secrecy from auditors or regulators; they need control over who can read their records.

Under controlled disclosure the network still verifies every payment, while the amounts and counterparties are visible only to the company, its auditor and its regulators.

Payment	What the public ledger shows	What a competitor learns	What the public sees with controlled disclosure
Salaries	Three transfers totalling $29,450 on the 25th of each month	Headcount and individual pay	Three payments of [redacted] to [redacted] Verified
Supplier invoice	$184,000 to an address analytics tools label Kestrel Components	The main supplier, its price and terms	One payment of [redacted] to [redacted] Verified
Customer receipt	$420,000 in from an address labelled Orion Retail	A key customer and the contract size	One receipt of [redacted] from [redacted] Verified
Treasury transfer	$2.4M to an exchange deposit address	A likely sale, before it settles	One transfer of [redacted] to [redacted] Verified

Fictional company, names and amounts, for illustration.

FORCE ONE

Exposure gets cheaper

Models parse transaction histories at a scale that once took analysts weeks, so watching a public ledger costs close to nothing.

FORCE TWO

Private data gets more valuable

Useful assistants need email, records and preferences to work, so people and companies disclose more to them.

Demand for computation that uses data without exposing it

NEAR AI Cloud Live

Confidential inference since December 2025

Nillion Building

Multi-party computation, backed by Hack VC

Seismic Building

Secure hardware, backed by a16z

AI lowers the cost of surveilling public ledgers while raising the value of the data they expose

Both forces increase the cost of operating in public.

"For users that prioritize privacy, this could become a 'must-have' feature."

Zach Pandl, Head of Research, Grayscale, September 2026

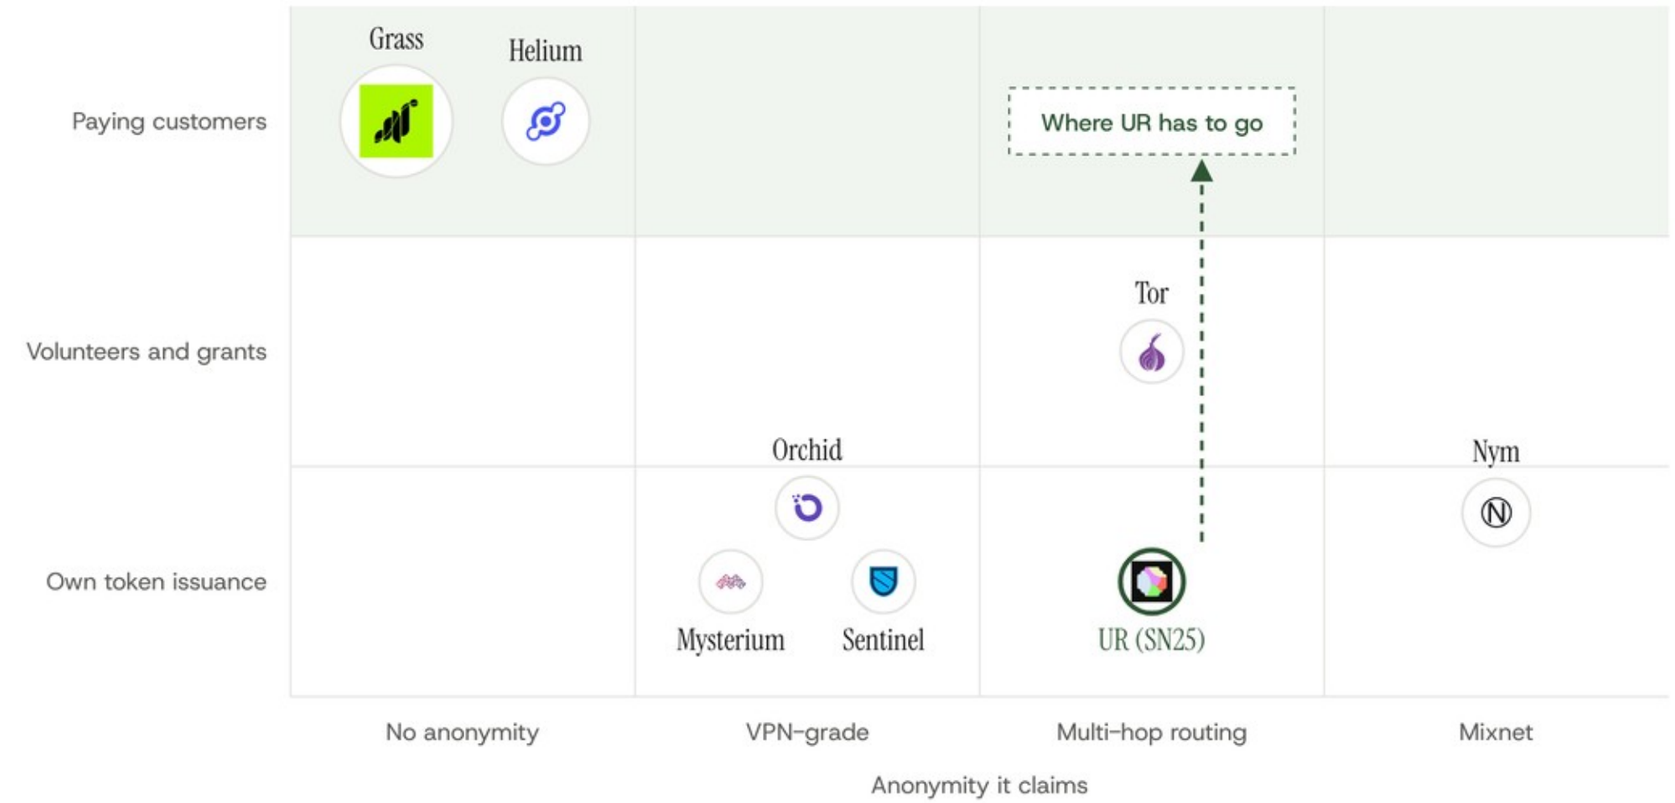

Grayscale's view is that AI adoption will lift demand for financial privacy.

Only five of the 18 privacy projects we track protect who the user is

Each project sits in the layer it protects. At the network layer, only UR and Nym ensure that no single server sees both ends of a connection.

Hides who you are 5 projects	**Network** Your IP and who you talk to	**UR (SN25)** Mesh routing	**Nym** Mixnet	**Orchid** Bandwidth market	**Sentinel** Decentralised VPN	**Mysterium** Decentralised VPN
Hides what you send 13 projects	**Computation** App and AI inputs	**NEAR AI** Secure hardware	**Seismic** Secure hardware	**Nillion** Multi-party compute	**Zama** Encrypted compute	**Nockchain** Early ZK proof of work
	Applications Contract state and activity	**Fhenix** Encrypted compute	**Aztec** ZK rollup	**Aleo** ZK layer 1		
	Payments and assets Balances and counterparties	**Zcash** Shielded pool	**Railgun** Shielded pool	**Privacy Pools** Shielded pool	**Umbra** Nimbus Solana wallet	**USAD** Private stablecoin

Khala Research classification by the main thing each project hides; several projects combine techniques.

Circle size: market cap, CoinGecko and MEXC, 15 October 2026. Tor has no token.

Nym offers stronger anonymity guarantees, so UR must compete on network reach and price

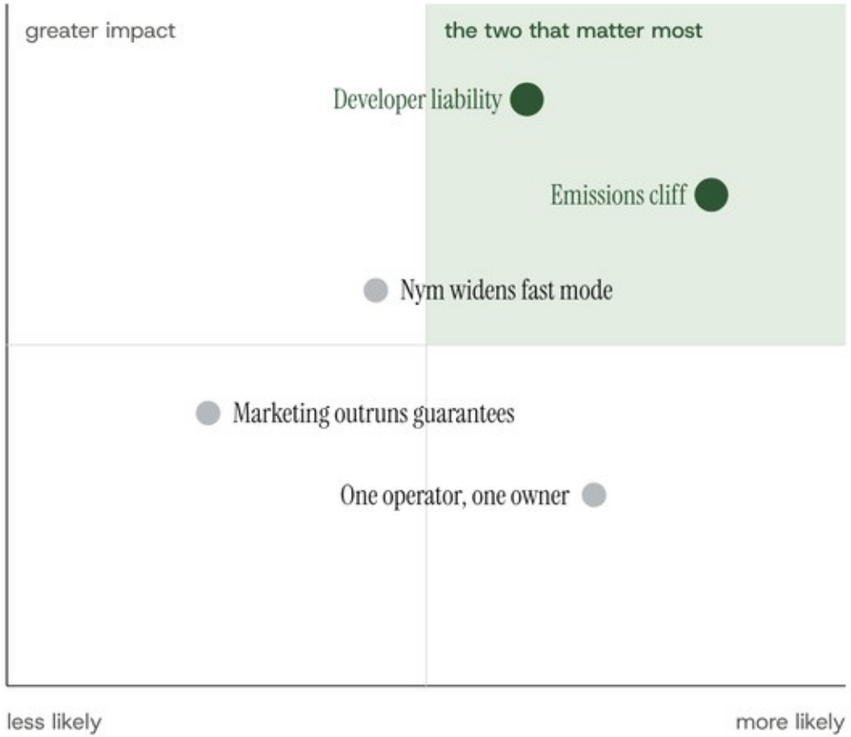

UR's central challenge is establishing who pays for its supply.

Nym combines stronger anonymity with its own VPN, so UR is better positioned as a complement than as a replacement.

Networks funded by their own token issuance cluster at the bottom of this chart; Grass and Helium moved up by securing paying customers.

A court ruling and staker outflows are the two risks capable of breaking the UR thesis

The Storm retrial is scheduled for April 2027, while stakers can withdraw from SN25 at any time.

Risk	What would have to happen	Signal to watch
Developer liability	Roman Storm's retrial on the laundering and sanctions counts, set for 26 April 2027, ends in a conviction and reopens exposure for privacy developers.	Rulings on the pending acquittal motion; the retrial verdict
Emissions cliff	Stakers pull TAO from SN25 before deposits begin, and miner pay and exit coverage shrink together.	Net TAO flow into SN25, month by month
Nym widens fast mode	Nym, with a VPN, a16z backing and rewards moving to real traffic, takes the operators UR needs.	Nym's browser and wallet integrations
Marketing outruns guarantees	URnetwork markets Tor-like anonymity while UR claims no defence against a global observer, and a public deanonymisation lands.	Independent audits of URnetwork's privacy claims
One operator, one owner	BringYour stays the only operator, the owner stays the largest validator, and its multisig keeps control of settlement with no upgrade timelock yet.	A second operator; the timelock going live

Khala Research judgement of likelihood and impact.
